Sprint 2 Burndown chart

ACTIVE   Add user interaction and dynamically render pages.

The velocity of our sprint 2 displays that there is no progress during the first week of the sprint until February 28th. However, because our team was working on the subtasks at the beginning which does not count toward the points, and began to complete the user stories toward the end of the sprint to bring down the burndown score. There is a bump in the velocity during March 1st and 2nd as we decided to update the priority of some of our user stories.

The burndown chart shows that there are more points than sprint 1 and it is true. There are more user stories in Sprint 2 and each story has a heavier workload and requires a fair amount of work to commit in. Some user stories are correlated with each other which requires frequent meetings between our group members who work on different user stories. For example, the user story "update listing" cannot be done without the user story "create listing" in order to test functionality. The number of heavier user stories has slowed down the velocity of the burndown chart and more incomplete user stories.
